TMA3084/TMA3083 Software Engineering Laboratories
Project Evaluation Rubrics
(Testing and Release)
(10%)

These assignment rubrics are used to assess two deliverables, which are as follows:

Deliverables	Percentage (%)
A. Testing	5
B. System Demo / Release	5
TOTAL	**10**

	Section A: Testing (10 marks)	Section B: System Demo/Release (10 marks)	Percentage (%)
CLO2	**/10**		**/5**
CLO3		**/10**	**/5**

Section A: Testing (10 marks)

Criteria for assessment	*Performance levels*			
	Proficient (80 – 100%)	**Competent (50 – 79%)**	**Apprentice (20 – 49%)**	**Novice (0 – 19%)**
Testing Completeness (3% weighting)	More than 90% of the software application is covered.	Around 60% of the software application has been covered.	Around 40% of the software application has been covered.	Less than 30% of the software application has been covered.
Testing, Analysis, and Evaluation (4% weighting)	1. Comprehensive and systematic testing methodology that ensures meeting all requirements. 2. Rigorous analysis of some system attribute(s), supported by experimental results.	1. Systematic testing methodology that ensures meeting some requirements. 2. Plausible analysis of some system attribute(s) without experimental evidence.	1. Arbitrary testing methodology that ensures meeting some system requirements. 2. Incorrect analysis of some system attribute(s).	1. No testing. 2. No analysis of any system attributes.
Testing Correctness (3% weighting)	The testing methods have been correctly applied.	The testing methods are applied correctly in most cases.	The testing methods are applied correctly in some cases.	No testing method

Section D: System Demo / Release (10 marks)

Criteria for assessment	*Performance levels*			
	Proficient (80 – 100%)	**Competent (50 – 79%)**	**Apprentice (20 – 49%)**	**Novice (0 – 19%)**
Handling Issues (2% weighting)	1.Systematic and sound handling of issues, starting from simpler explanations to more complex ones. 2.Practical, non-ideal resolutions/workarounds are considered when necessary.	1.Sensible resolutions are found for most issues, starting from simpler explanations to more complex ones. 2.Work arounds, rather than proper resolutions, are excessively considered.	1. Too few reported issues. 2. Arbitrary handling of issues, e.g. simpler explanations are not eliminated first.	1. No issues reported
Tools and Standards (2% weighting)	1.Appropriate tools and standards are preferred over custom solutions. 2.Tool and/or standard selection is reasonably justified.	1.Appropriate tools and standards are preferred over custom solutions. 2.No justification of tool and/or standard selection.	1.Some tools or standards are used, but custom solutions are sometimes used instead. 2.No justification of tool and/or standard selection.	No engineering tools or standards used, or none reported.
Delivery and Handling of Questions (2% weighting**)**	1. Excellent pace, projects voice, enthusiastic. 2. Answers questions effectively and smoothly.	1. Good pace, usually projects voice, some enthusiasm. 2. Answers questions adequately.	1.Somewhat fast, some um's, little projecting of voice, little enthusiasm. 2.Rarely answers questions adequately.	1. Too fast, too many um's, not projecting voice, lack of enthusiasm. 2. Does not answer questions adequately.
Progress and System completeness (4% weighting**)**	1.Made sufficient progress so far to complete the project in time. 2.System is well-presented , painting a clear picture of project progress.	1.Progressing slowly. Need to pick up the pace to complete the project in time. 2.System is partially presented, leaving many questions unanswered.	1.Noticeably behind schedule. Completing the project is questionable. 2.System is barely presented.	1.Completing the project appears to be infeasible. 2.No useful presentation of system.
